Re Item V

Reasoned statement under Art. 35(2) with regard to novelty, inventive step or industrial applicability.

The application does not meet the requirements of Art. 33 PCT since claims 1-10, 12-27 and 29-32 are not novel, and claims 11 and 28 do not appear to contain an inventive step.

- 1) Reference is made to the following documents (the document numbering corresponds to their order of citation in the international search report):
 - D1: DE GROOT CORLINE J A ET AL: 'Establishment of human adult astrocyte cultures derived from postmortem multiple sclerosis and control brain and spinal cord regions: Immunophenotypical and functional characterization.' JOURNAL OF NEUROSCIENCE RESEARCH, vol. 49, no. 3, August 1997 (1997-08), pages 342-354, XP000864697 NEW YORK US ISSN: 0360-4012
 - D2: WO 94 01135 A (UNIV NEW YORK) 20 January 1994 (1994-01-20)
 - D4: LIN Q ET AL.: 'Human fetal astrocytes as an ex vivo gene therapy vehicle for delivering biologically active nerve growth factor' HUMAN GENE THERAPY, vol. 8, no. 3, 10 February 1997 (1997-02-10), pages 331-339, XP000864703 NEW YORK US

Novelty under Art. 33(2) PCT.

2) The method of claim 1 extends to the isolation or propagation of a population of astrocytes. Identical or similar methods have been disclosed repeatedly in the prior art. For instance, document D1 describes the isolation of astrocytes from adult human brain. The authors of D1 employ selective attachment of astrocytes to poly-L-lysine covered culture vessels, and removal of non-attached cells after 48 hours (page 344). This method leads to the recovery of a >95% pure astrocyte population as assessed by GFAP staining (page 347). Successive passages displayed even higher uniformity of population (>98%, page 347).

Therefore, claims 1-6, and claims 13-18 lack novelty.

3) Likewise, the procedures described in D4 include the isolation of human embryonic astrocytes by the method of McCarthy and de Vellis. This method, which is commonly known in the field, utilizes the differential attachment of astrocytes and other cell types, and allows to obtain populations of >98% purity (see McCarthy and de Vellis (1980), J. Cell Biol. 85(3), 890-2).

The authors of D2 use thusly isolated human astrocytes for retrovirus-mediated transduction of murine B-NGF (Nerve Growth Factor) cDNA under the control of the MoMuLV LTR promoter.

Accordingly, the method of D4 constitutes subject-matter of present claims 7-9, 12, 19-21, 24-27, 29-30 and 32 which consequently lack novelty.

- Although adenoviral gene delivery as claimed in claim 10 was not performed by the 4) authors of D4, the document describes that besides retroviral transfer, also gene transfer through adenoviruses is "likely to be applicable" (pg. 337). Claims 10 and 22 are therefore not considered as being novel.
- While the method of D2 includes the essential features of claim 11 (isolation of rat 5) astrocytes by adhesion and removal of nonadherent cells, subsequent introduction of external DNA through calcium phosphate precipitation), the method differs insofar as astrocytes are isolated after a 5 to 6 day attachment period rather than after two days. Claim 11 can therefore be regarded as being novel.
- As a consequence of the product-by-process definition of claim 23, known subject-6) matter falls within the terms of the claim. For example, extrachromosomal DNA introduced by viruses is not distinguishable from the same DNA introduced by transfection. Similarly, integrated or native chromosomal DNA is not distinguishable from transfected and chromosomally recombined DNA. Claim 23 is therefore not novel.
- 7) The use of an astrocyte population as an implant according to claim 31 has been frequently described (see e.g. the application itself, desc. pg. 2; D2, pg. 2, 1.22-pg. 3, I. 25, and references therein). Claim 31 therefore lacks novelty.

Inventive Step under Art. 33(3) PCT.

INTERNATIONAL PRELIMINARY

International application No. PCT/IB00/00165

EXAMINATION REPORT - SEPARATE SHEET

- Novel claims 11 and 28 differ from the prior art in minor points only. 8) The method of claim 11 is different to closest prior art, document D2, in the time of attachment of astrocytes only (see also sect. V.6). The IPEA does not see an unexpected result from the change from 5-6 days (D2) to 2 days of attachment. Furthermore, the skilled person would routinely investigate transfection (e.g. by calcium phosphate) of a human astrocyte culture as obtained through the method of D1, especially since D2 shows that rat astrocytes are transfectable by that method. Claim 11 therefore lacks an inventive step.
- The use of DNA encoding an antisense-RNA, as referred to in claim 28, is a trivial 9) alteration in a transfection method in general, and is not inventive.
